CSC311 Design and Analysis of Algorithms
Third Semester 1444
Instructor: Prof. Mohamed Maher Ben Ismail

Tutorial #2

1. Consider the pseudo-code below:

ALGORITHM *MaxElement*(***A***[0..***n*** − 1])

```
//Determines the value of the largest element in a given array
//Input: An array A[0..n − 1] of real numbers
//Output: The value of the largest element in A maxval ← A[0]
for i ← 1 to n − 1 do
    if A[i] > maxval
        maxval ← A[i]
return maxval
```

a. What is the basic operation of this algorithm?
b. Give the best-case and worst-case time complexities of this algorithm in asymptotic notation.

2. Consider the algorithm below and give its best-case and worst-case time complexities in asymptotic notation.

ALGORITHM *UniqueElements*(***A***[0..***n*** − 1])

```
//Determines whether all the elements in a given array are distinct //Input: An array A[0..n − 1]
//Output: Returns “true” if all the elements in A are distinct // and “false” otherwise

for i ← 0 to n − 2 do
    for j ← i + 1 to n − 1 do
        if A[i] = A[j ] return False
return True
```

3. Consider the algorithm below:

ALGORITHM ***F(n)***

//Computes ***n***! recursively //Input: A nonnegative integer ***n*** //Output: The value of ***n***!

if $n = 0$ return 1

else return $F(n - 1) * n$

a. What is the algorithm's basic operation?
b. What is the resulting recursive equation?
c. Solve the equation you gave in (b).
d. What is the worst case time complexity of this algorithm?

4. Consider the algorithm below:

ALGORITHM ***Q(n)***

//Input: A positive integer ***n***

if $n = 1$ return 1

else return $Q(n - 1) + 2 * n$

a. What is the algorithm's basic operation?
b. What is the resulting recursive equation?
c. Solve the equation you gave in (b).
d. What is the worst case time complexity of this algorithm?
